

Proof Of Delivery + Data Vault

DigitalShipper Analytics captures all of your post-shipment information. And when it comes to knowing if your customer received their package or not, DigitalShipper Analytics takes the guesswork out of the equation.

With our POD (Proof of Delivery) system, you can easily search packages by tracking number or reference. If the package has been delivered, you will see all the critical delivery information: date delivered, location, status, name of person who accepted the shipment and signature (when requested and available from the carrier). Delivery information is available to print or email conveniently with the press of a button.

As a shipper, this is a valuable tool to extract delivery information that may need to be presented to the consignee, vendor or other third party as evidence that the package has been delivered to the recipient.

DigitalShipper Analytics POD receives a list of tracking numbers for UPS, FedEx and USPS once they have been shipped through your shipping software and we take care of the rest.

And if the package has not been delivered you have access to all the scans and details about the package so you can pinpoint where it is in the delivery process and if there are any issues.

DigitalShipper Analytics POD is ideal for companies that are in fulfillment distribution, managing vendor drop shipments, or any business that needs a pro-active way to see packages have been delivered.

Carriers only retain package delivery information for a short period of time. And there are times when you need to access this data long after the package has been delivered to the customer.

DigitalShipper Analytics stores the delivery information it receives from the carriers for however long you need to maintain the data. And the fact you can easily search for a package using the tracking number or reference puts the data at your fingertips within seconds.

The DigitalShipper Analytics Data Vault can store Proof of Delivery and package data for your desired retention period (i.e. 1 year, 10 years) making it ideal for audits including Medicare and other insurance providers. Additionally, fulfillment companies that need to verify delivery of goods to the end user can receive extracts of data.

With DigitalShipper Analytics you have the right tool to confirm and prove packages have arrived at their expected destination.

**With DigitalShipper Analytics
you don't have to guess if
your customer received
their package – you know.**
